

VIA Diamond polishing pads

Technical data sheet

You can polish all surfaces of VIA floors, which have been sealed with VIA mineral impregnation or VIA tile oil with the VIA diamond polishing pads to achieve a desired gloss level. Even floors laid decades ago, you can polish up with. Diamond polishing pads contains microscopic diamonds for mechanically cleaning and polishing our floors in using with water only.

Procedure:

The damp surface is treated with all three VIA pads in sequences. The pads have different colours and levels.

Step 1:

White pad (rough polishing)

Moisten the surface. The white pad removes minor scratches and leaves a silky matt, clean surface.

Step 2:

Yellow pad (medium polishing)

Moisten the surface. The surface is condensed and builds the basis for subsequent polishing.

Step 3:

Green pad (finest grain size)

The damp floor is worked over several times until it's dry.

The result is a closed and shiny surface.

This pad is also suitable for daily floor care.

Important:

Please ensure that the pads are fitted correctly on the machine!

The marked side must face upwards. The surface must be moistened; the pads have no polishing effect when used dry.
